

Survivorship Care Planning

Quick Tips Care Guide

Life after sarcoma treatment is supported by staying connected with your care team. A Survivorship Care Plan (SCP) is your roadmap for recovery—now and long-term.

What is a Survivorship Care Plan?

A personalized plan you create with your care team to keep communication and follow-up on track. It typically includes:

- **A summary of your treatment (diagnosis through end of treatment)**
Including medications and key therapies received
- **Your treating providers**
Who treated you and how to reach them
- **Your follow-up schedule**
Suggested exams, labs, imaging, and testing
- **Side effects to watch for**
What requires monitoring, treatment, or urgent evaluation
- **Guidance for healthy living + support**
Nutrition, exercise, emotional well-being, and caregiver support

Share your plan with all providers

Make sure your SCP is given to your regular healthcare team so everyone stays informed, such as your:

Primary care clinician, dentist, cardiologist, endocrinologist, and other specialists.

This helps them understand:

- what you've been through,
- what late effects to screen for,
- and what follow-up visits will include.

What to expect after treatment

You should expect **regular checkups** that may include:

physical exams, labs, x-rays, and scans—plus time to discuss symptoms or concerns.

Typical timing:

- **Every 3–6 months at first**
- **Less often after a few years**
- Your care team remains available anytime—and **urgent concerns (like a new lump) should be evaluated right away.**

Common long-term concerns (physical + emotional)

Late effects can appear **soon after treatment or years later**. You're not alone—support is part of survivorship care.

Physical possibilities include:

- Heart problems
- Hearing loss
- Limb loss or prosthetic needs
- Chronic pain
- Fertility issues

Emotional concerns are common too:

- Anxiety about recurrence or new issues
- Resentment, guilt, or grief
- Concerns about discrimination
- Difficulty adjusting to physical changes
- Dating, marriage, and family-planning concerns

Rehab and supportive care can help

Post-treatment rehab focuses on improving strength, mobility, and quality of life—support may include help managing:

- Pain, swelling, lymphedema
- Range of motion, flexibility, balance
- Skin changes
- Anxiety/mood concerns
- Weakness, tingling, numbness
- Fatigue and “brain fog”
- Bowel/bladder changes
- Sexual dysfunction
- Dietary concerns

Support team members may include:

- **Dietitians**
nutrition plans, eating challenges
- **Lymphedema therapists**
swelling + pain control using compression, massage, exercise
- **Occupational therapy (OT)**
daily activities, independence, prevention of disability
- **Physical therapy (PT)**
mobility, strength, function
- **Psychology/psychiatry**
therapy, coping skills, medication management when needed
