

Survivorship & Recovery

Quick Tips – Care Guide

Survivorship is more than simply completing treatment.

For many sarcoma and leiomyosarcoma patients, survivorship is a gradual process of healing, rebuilding strength, adapting to change, and learning how to move forward physically and emotionally after diagnosis and treatment.

Recovery often includes:

- rebuilding stamina,
- restoring nutrition,
- managing fatigue,
- addressing emotional stress,
- regaining confidence,
- and finding a “new normal” one step at a time.

Healing Takes Time

Many patients feel pressure to “bounce back” quickly after treatment. However, recovery is often slower and more complex than expected.

Patients may continue to experience:

- fatigue,
- muscle weakness,
- appetite changes,
- anxiety before scans,
- emotional overwhelm,
- sleep disruption,
- or fear of recurrence.

These experiences are common and valid.

Healing is not only physical — it is emotional and psychological as well.

Strength Recovery Matters

Maintaining and rebuilding strength after treatment is extremely important.

Recovery may involve:

- nutrition support,
- hydration,
- physical therapy,
- gentle movement,
- survivorship rehabilitation,
- emotional support,
- and ongoing communication with the healthcare team.

Even small daily improvements matter.

Nutrition is Part of Recovery

Good nutrition during survivorship is not about perfection or restrictive diets.

It is about:

- nourishing the body,
- preserving muscle mass,
- supporting healing,
- maintaining energy,
- protecting heart and bone health,
- and improving quality of life.

Recovery nutrition should be individualized and compassionate.

Survivorship also Includes Emotional Recovery

Many patients and caregivers continue carrying emotional stress long after treatment ends.

It is important to recognize:

- survivorship anxiety,
- caregiver exhaustion,
- grief,
- uncertainty,
- and emotional fatigue.

Seeking support is a sign of strength, not weakness.

Caregivers Need Recovery Too

Caregivers often spend months or years focusing entirely on the patient's needs while neglecting their own wellbeing.

Caregiver recovery matters too.

Caregivers deserve:

- rest,
- emotional support,
- encouragement,
- and space to process their own experiences.

Survivorship is Not a Straight Line

Some days will feel encouraging. Some days may feel discouraging. Recovery is rarely linear.

Progress should not only be measured by scans or milestones — but also by:

- small moments of strength,
- improved mobility,
- meaningful connections,
- emotional resilience,
- and quality of life.

“You do not need to recover all at once. Healing happens gradually — through nourishment, movement, support, rest, resilience, and hope. Every step forward matters.”

The Goal of Survivorship Care

The goal is not simply to survive cancer. The goal is to help patients and caregivers:

- live as fully as possible,
- maintain dignity and independence,
- improve quality of life,
- feel supported,
- and continue moving forward with hope and purpose.
